

B) Most animals are observed to be more aggressive during their breeding season. However, in an attempt to study behaviour in Grants Gazelles, it was seen that two male gazelles approached each other, raised their heads and horns backwards, and left without indulging into a fight.

Identify and discuss the behaviour observed above. State the cost and benefits associated with the above behaviour. Explain the significance of natural weapons as means to display aggression. Is aggression innate or learned? Justify with the help of an example.
